

How deep should you water?

It's as easy as 1-2-3!

1. Water small plants such as cacti & annuals to a depth of **1 foot**.
(Grass should be watered to a depth of 10 inches.)
2. Water medium plants such as shrubs to a depth of **2 feet**.
3. Water large plants such as trees to a depth of **3 feet**.

How to use your soil probe:

1. Water soil for 30 minutes.
2. Wait 30 minutes.
3. Insert probe into soil.
 - a. Probe will glide relatively easily through moist soil, but stop at dry soil.
4. Remove probe from soil and measure the depth of irrigation.

Example: To water a tree to a depth of 3 feet; if after 30 minutes of watering you have watered to a depth of 1 foot, then you would water 90 minutes to get down to 3 feet. This is the duration of watering and it does not change through the year.
